Abstract not available for JP2002505414T

Abstract of corresponding document: **DE19808273**

The invention relates to an interferometric measuring device (1) for determining the profile of rough surfaces. A spatially coherent beam generating unit is provided. Said unit emits temporally briefly coherent wideband radiation. The device is divided into a section with the components of a modulation interferometer (2) and a section with the components of a measuring probe (3). The measuring probe (3) is linked to the modulation interferometer (2) by an optical fibre system (6) and can be used at a distance from the modulation interferometer (2).
